Based on the realisation that we can not think separatedly from the nature, and the natural law, we should consider to build a system, that actually not produce any excess. In the nature, everything that one gives out, another can use, and transform. Ignoring this led us now to the edge of resources.

One idea is to give taxes to the factories that pollute. Because one or another always has to pay after the pollution. It coul'd give more balance, if the one that causes, would pay for it. It could give value to the ideas, the inventions in the topic of Earth-care.

We should maybe go along the thought of giving economical value, to the things we want to see as precious.
